# ID Card Generator - Project Problem Statement

Team 5 : Prathmesh Suryavanshi and Siddhi Gaikwad

## 🎯 What You Need to Build

Create a **fully functional web application** where organizations (colleges, companies, etc.) can:

1. Upload their ID card template
2. Upload student/employee data in bulk
3. Map data fields to positions on the template
4. Generate a PDF with all ID cards

**Timeline:** 7 days

---

## 📝 Core Features

### 1. User Login & Registration System

**Organization/University Onboarding:**

- Registration form for universities/colleges/companies
- Required fields:
  - Organization Name
  - Organization Type (University/College/Company)
  - Email (will be used for login)
  - Password
  - Contact Person Name
  - Phone Number
  - Address (optional)

**User Authentication:**

- Login with email and password
- Logout functionality
- Each organization manages their own ID cards independently
- Secure password storage (hash passwords)

**Note:** Keep it simple - no admin approval needed. Once registered, users can login immediately.

## 2. Template Upload

- User uploads an ID card template image (PNG or JPG)
- Store template with organization details
- Support different template sizes

## 3. Data Upload

- User uploads an Excel or CSV file containing student/employee information
- The file will have columns like: name, roll_no, mobile, blood_group, address, photo, etc.
- Validate file format and data structure
- Show preview of uploaded data

## 4. Drag & Drop Field Mapping ⭐

**This is the main challenge:**

- Show the uploaded template on screen
- Display all column names from the CSV/Excel as draggable items
- User drags each field (like "Name", "Roll No") and drops it on the template where they want it to appear
- User should be able to position each field exactly where they want on the ID card
- Allow field customization (font size, color - optional)

**Example:**

```
Template: [College ID Card Image]
```

```
Draggable Fields:
- Name
- Roll No
- Blood Group
- Department
- Photo

User drags "Name" → drops at top center
User drags "Roll No" → drops at bottom left
User drags "Photo" → drops at top right
... and so on
```

## 5. Preview

- Show how the final ID card will look with sample data
- Display at least one complete ID card before generating all
- Allow users to adjust positions if needed

## 6. Generate PDF

- Create a PDF file containing ALL ID cards from the uploaded data
- One card per page (or multiple cards per page - your choice)
- All fields should appear at the correct positions
- Include photos if provided in the data
- High-quality output suitable for printing

## 7. Dashboard

- Clean, professional interface
- View all uploaded templates
- Download generated PDFs
- See history of generated cards
- Organization profile management
- Delete/edit templates

---

# 🤖 AI Integration Feature ⭐ (MANDATORY)

**AI-Powered Design Assistant**

Implement an AI assistant that helps users create better ID card designs:

## Feature 1: Smart Design Recommendations

When user uploads a template or starts creating one, AI provides:

- Color scheme suggestions based on organization type
- Layout recommendations (where to place photo, name, logo)
- Font style suggestions for professional look
- Best practices for ID card design

**Example:**

```
User: Selects "University" as organization type
AI Response:
"For university ID cards, we recommend:
- Colors: Blue and white for formal look
- Photo: Top-left corner, 2×2 inch size
- Name: Center-top in bold font
- Logo: Top-right corner
- Use clear, readable fonts like Arial or Roboto"
```

## Feature 2: Template Analysis (Optional Bonus)

When user uploads a template image:

- AI analyzes the template
- Suggests improvements (contrast, spacing, readability)
- Identifies potential issues

**Implementation Options:**

- Use OpenAI API (ChatGPT) - has free tier
- Use Anthropic Claude API - has free tier
- Use Google Gemini API - free
- Any other AI API of your choice

**Where to integrate:**

- During organization onboarding (ask about preferences)
- On template upload page (show suggestions)
- As a "Help" button on the design page

---

# 📊 Sample Data Files

## Student Data CSV

**student_data.csv**

```
photo,name,roll_no,mobile,blood_group,address,department,year
photo1.jpg,John Doe,2024001,9876543210,O+,123 Main St Mumbai,Computer Science,3rd Year
photo2.jpg,Jane Smith,2024002,9876543211,A+,456 Park Ave Delhi,Electronics,2nd Year
photo3.jpg,Mike Johnson,2024003,9876543212,B+,789 Lake Rd Bangalore,Mechanical,1st Year
photo4.jpg,Sarah Williams,2024004,9876543213,AB+,321 Hill View Pune,Civil Engineering,4th Year
photo5.jpg,David Brown,2024005,9876543214,O-,654 Beach Road Chennai,Information Technology,2nd Year
photo6.jpg,Emily Davis,2024006,9876543215,A-,987 Garden Lane Hyderabad,Electrical Engineering,3rd Year
photo7.jpg,Robert Wilson,2024007,9876543216,B-,246 River Side Kolkata,Chemical Engineering,2nd Year
photo8.jpg,Lisa Anderson,2024008,9876543217,AB-,135 Mountain View Jaipur,Biotechnology,1st Year
photo9.jpg,James Taylor,2024009,9876543218,O+,579 Valley Road Lucknow,Architecture,4th Year
photo10.jpg,Maria Martinez,2024010,9876543219,A+,864 Lake View Ahmedabad,Fashion Design,3rd Year
```

---

# 🎨 User Flow

```
1. Organization Registration
   ↓
2. Login to Dashboard
   ↓
3. Upload ID Card Template
   → AI provides design suggestions
   ↓
4. Upload Student Data (CSV/Excel)
   ↓
5. Drag and drop fields onto template
   ↓
6. Preview ID cards
   ↓
7. Generate PDF
   ↓
8. Download PDF
```

---

# 💻 Recommended Tech Stack

## Frontend (Suggested)

- **React.js** (Recommended) - for building interactive UI
- **Tailwind CSS** or **Material-UI** - for styling
- **react-dnd** or **dnd-kit** - for drag-and-drop functionality
- **Axios** - for API calls

## Backend (Suggested)

- **Node.js + Express.js** (Recommended) - for REST API
- **MongoDB** or **PostgreSQL** - for database
- **Multer** - for file uploads
- **PDFKit** or **jsPDF** - for PDF generation
- **bcrypt** - for password hashing
- **jsonwebtoken (JWT)** - for authentication

### Deployment (Required)

- **Frontend:** Vercel, Netlify, or GitHub Pages
- **Backend:** Render, Railway, Heroku, or AWS
- **Database:** MongoDB Atlas (free tier) or PostgreSQL on Render

### AI Integration

- **OpenAI API** / **Claude API** / **Google Gemini** - for design suggestions

**Note:** You have complete freedom to choose any technology stack. The above is just a recommendation to help you get started quickly.

---

## 📋 Complete Deliverables

### 1. Fully Working Deployed Application ⭐ (PRIMARY)

- **Live URL** that anyone can access
- All features working end-to-end
- Responsive design (works on desktop/tablet)
- No broken features or errors
- Fast loading times

### 2. Source Code Repository

- GitHub repository with clean commit history
- Well-organized folder structure
- Clear code comments
- `.env.example` file for environment variables

### 3. Complete Documentation 📚

### A. README.md (Mandatory)

Include:

- Project title and description
- Features list

- Tech stack used
- Prerequisites (Node.js version, etc.)
- Installation steps (step-by-step)
- Environment variables needed
- How to run locally
- Deployment instructions
- Screenshots of main features
- Live demo link
- AI integration details

### B. API Documentation (Mandatory)

- **Postman Collection** exported as JSON
- All API endpoints documented:
  - Endpoint URL
  - Method (GET, POST, PUT, DELETE)
  - Request body format
  - Response format
  - Sample requests and responses
  - Authentication requirements
- Include in repository as `API_DOCUMENTATION.md` or Postman collection

### C. Frontend Documentation

- Component structure explanation
- Key functions and their purposes
- State management approach
- How drag-and-drop works
- How PDF generation works

## 4. Product Hunt Launch Materials 🚀

### A. Launch Plan Document

Create a document with:

- Product tagline (one compelling sentence)
- Product description (2-3 paragraphs)
- Target audience
- Key features to highlight
- Launch date and time strategy
- First comment plan (what you'll post first)

### B. Visual Assets

- **Product Icon/Logo** (240×240px minimum)
- **Cover Image** (1270×760px) - hero image for Product Hunt
- **Gallery Images** (at least 3-5 screenshots showing key features)
- **Demo GIF/Video** (optional but highly recommended)

### C. Social Media Assets

- **Twitter/X announcement post** (text + image)
- **LinkedIn post** (text + image)
- **Instagram story template** (optional)
- All images should be professional and branded

## 5. Marketing Plan 📈

Create a document covering:

### A. Pre-Launch (Before Product Hunt)

- Build landing page
- Create social media accounts
- Engage with Product Hunt community
- Prepare email list (if any)

### B. Launch Day

- Posting schedule (when to post on which platforms)
- Engagement strategy (responding to comments)
- Influencer outreach (if any)
- Community engagement plan

### C. Post-Launch

- Follow-up content plan
- User feedback collection
- Feature update announcements
- Growth strategies

### 6. Demo Video (Recommended)

- 2-3 minute walkthrough
- Show all major features
- Professional voice-over or captions
- Upload to YouTube/Loom

---

## 📅 Suggested 7-Day Timeline

### Day 1-2: Setup & Authentication

- [ ] Set up project structure
- [ ] Implement registration/login
- [ ] Set up database
- [ ] Basic dashboard UI

### Day 3-4: Core Features

- [ ] Template upload functionality
- [ ] CSV/Excel upload and parsing
- [ ] Drag-and-drop field mapping
- [ ] Store field positions

### Day 5: PDF Generation & AI

- [ ] Implement PDF generation
- [ ] Integrate AI design assistant
- [ ] Testing and bug fixes

### Day 6: Deployment & Documentation

- [ ] Deploy frontend and backend
- [ ] Write complete documentation
- [ ] Create Postman collection
- [ ] Test deployed version

### Day 7: Marketing Materials

- [ ] Create Product Hunt assets
- [ ] Write launch plan
- [ ] Prepare marketing materials
- [ ] Record demo video
- [ ] Final testing

---

## ✅ What Will Be Evaluated

### Technical Implementation (50%)

1. ✓ Working deployed application
2. ✓ All core features functional
3. ✓ Clean, bug-free code
4. ✓ Proper authentication & security
5. ✓ Drag-and-drop accuracy
6. ✓ PDF quality
7. ✓ AI integration working

### Documentation (25%)

1. ✓ Complete README
2. ✓ API documentation (Postman)
3. ✓ Clear setup instructions
4. ✓ Code comments

### Product & Marketing (25%)

1. ✓ Professional UI/UX
2. ✓ Product Hunt materials ready
3. ✓ Marketing plan quality
4. ✓ Visual assets quality
5. ✓ Demo video (if provided)

---

## 💡 Development Tips

### Getting Started:

1. Start with authentication - get login/register working first
2. Build one feature at a time, test it, then move to next
3. Use AI tools (ChatGPT, Claude, Copilot) when stuck
4. Deploy early (even with partial features) to catch issues
5. Test with real data frequently

### For Drag-and-Drop:

- This is the trickiest part - allocate 1-2 days for this
- Test with different screen sizes
- Make sure positions are saved correctly
- Use console.log to debug coordinate issues

### For PDF Generation:

- Test with small datasets first (5 cards)
- Then scale to larger datasets (50+ cards)

- Check PDF quality and layout
- Ensure photos render correctly

### For AI Integration:

- Start with simple prompts
- Most AI APIs have free tiers - use them
- Show AI suggestions in a clean, non-intrusive way
- Make it actually helpful, not just decorative

### For Deployment:

- Test locally thoroughly before deploying
- Use environment variables for API keys
- Check CORS settings
- Test the deployed version completely

---

## ⚠️ Important Requirements

### Must Have:

- ✅ Deployed and accessible URL (not localhost)
- ✅ Working authentication system
- ✅ All features functional
- ✅ Complete API documentation with Postman
- ✅ Professional README
- ✅ AI feature implemented and visible
- ✅ Clean, organized code

### Security:

- Hash passwords (never store plain text)
- Validate all file uploads
- Implement proper authentication

- Sanitize user inputs
- Use environment variables for secrets

### Quality:

- No console errors in browser
- Fast loading times (optimize images)
- Proper error messages
- Mobile-friendly (responsive)
- Professional design

---

## 🚀 Bonus Points (Optional)

### Technical Bonuses:

- Multiple cards per PDF page (grid layout)
- Real-time collaboration (multiple users)
- Template marketplace
- QR code generation on cards
- Email notifications
- Dark mode
- Advanced AI features (template generation)

### Marketing Bonuses:

- Professional demo video
- Active social media presence
- Early user testimonials
- Press release
- Blog post about the project

---

## 📦 Submission Checklist

Before submitting, ensure you have:

- [ ] Live deployed URL (test it yourself)
- [ ] GitHub repository with all code
- [ ] README.md with complete instructions
- [ ] Postman collection (exported JSON)
- [ ] API documentation file
- [ ] Product Hunt materials folder with:
  - [ ] Launch plan document
  - [ ] Logo/icon image
  - [ ] Cover image
  - [ ] 3-5 feature screenshots
  - [ ] Social media posts (text + images)
- [ ] Marketing plan document
- [ ] Demo video or detailed screenshots
- [ ] Sample CSV file with 10+ records
- [ ] Sample template image

---

## 📧 Support & Questions

If you have questions or need clarification on any requirement, feel free to ask.

### Quick Tips:

- **Stuck on something?** Use ChatGPT/Claude to help debug
- **Not sure about a feature?** Build the simplest version first
- **Running out of time?** Focus on core features, skip bonus features
- **Deployment issues?** Check documentation of hosting platform
- **PDF not working?** Test with minimal data first

---

## 🎯 Success Criteria

Your project will be considered successful if:

1. ✅ Anyone can visit your URL and use the application

2. ✅ Registration, login, upload, drag-drop, and PDF generation all work
3. ✅ Documentation is clear enough for someone to run it locally
4. ✅ AI feature is visible and functional
5. ✅ Product Hunt materials are professional and ready to use
6. ✅ Code is clean and well-organized

**Remember:** A working deployed application with good documentation is better than a perfect local application with no documentation.

---

**Good luck with your project!** 🎉

Focus on:

1. **Getting it working** (functionality first)
2. **Deploying it** (make it accessible)
3. **Documenting it** (make it understandable)
4. **Marketing it** (make it presentable)

You have 7 days - plan your time wisely and build something great! 💪
